A woman of 27 had been treated for the last 3 yr. with nitrogen-mustard, urethan, splenectomy and X-rays, as typical myelogenous leukaemia was diagnosed. In the course of the last remission there suddenly appeared tumours in various places and monocytoid cells in the peripheral blood (to 84%). The white blod count rose to 394,000 per cu. mm. Reticulosarcoma was diagnosed by biopsy and confirmed at the post - mortem examination.

Master of Engineering

TITLE:

Steel for Bearings

PERIODICAL:

Wiadomosdi Hutnicze, 1960, No. 6, pp. 177 - 181

TEXT: After a brief description of ball and roller bearings, the authors state that the production of bearings in Poland is a relatively new industry, having been started several years after the second World War. The Polish PN-53/H-84041 standard, which is similar to the Soviet GOST 801-47 standard, distinguishes 4 types of bearing steel (Table 1). Only 2 types are being produced, i.e. the FH15 and FH15SG. The FH15, which is also cheap, is considered by Polish and other experts, including the Deutsche Edelstahlwerke (German Fine Steel Works) as being of very good quality with a high resistance to attrition. Its hardness degree is 65 HRc. The FH15SG steel, designed for large bearings used in rolling stock, heavy machinery etc, differs from the HH15 steel only by its higher manganese content (1.10% as against 0.95%) and silicone content (0.65% as against 0.40%). The authors deal with the processing of bearing steel in general and describe the conventional casting, testing, etc, of such steel. The above-

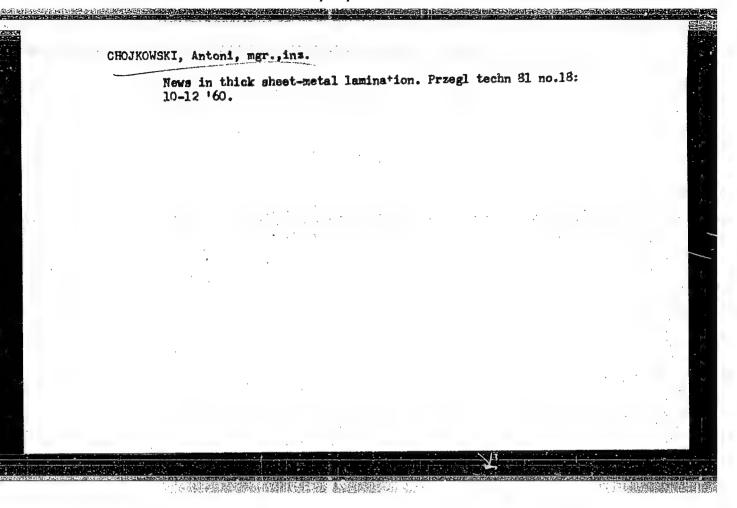

Card 1/2

Steel for Bearings

P/043/60/000/06/02/003

mentioned Polish and Soviet standards include tables for testing the purity of steel, which are based on the Diergarten scale widely used in the West. The Polish PN-53/H-84041 standard has 4 tables for testing the content of steel, including the sulfide and oxide content. Since the globular impurities have not been taken into account the EH15SO steel used for railroads has to be tested for other impurities, not only according to the Polish tables, but also to the more detailed Diergarten scale which takes into account also the nonmetallic impurities contained in steel. This practice was enforced by the MPC instruction dated September 2, 1959. The PN-53/H-84041 standard distinguishes also 2 qualities of steel, i.e. quality I (meant for heavy-duty bearings) and quality II (for common bearings). Details of these two qualities of steel and their properties under various processing conditions are given in Table 2. In conclusion the authors state that there are 2 schools of thought in Poland regarding the quality control of bearing steel. One school represented by the mechanical engineering industry advocates a stricter control, while the other school, also widely spread in the West, strives for simplicity, faster production and less waste of time. There are 2 tables, 2 figures and 1 set of photos.

TITLE: Electric conductivity of hexamethylbenzene

SOURCE: Acta physica polonica, v. 30, no. 5, 1966, 715-720

TOPIC TAGS: electric conductivity, hexamethylbenzene, molecular interaction, hydrogen atom reaction, current carrier, mobility, BENZENE

ABSTRACT: The article deals with measurements of the electron conductivity of hexamethylbenzene (in the form of pellets) in the temperature range 85—135C. The change of conductivity, occurring at the transition point (~110C), amounts to about a factor of 2. The effect observed can be explained in terms of molecular interaction by means of hydrogen atoms of methyl-groups. The author concludes that the interaction between adjacent molecules due to the interaction by means of hydrogen atoms of methyl groups plays an inportant role in the transport of the charge carrier through the crystal. Chem. Phys., 35, 1275 (1961); J. L. Katz, S. A. Rice, S. I. Choi, J. Jortner, J. Chem. Phys., 39, 1683 (1963)] in which a theoretical attempt of calculating the ratio of mobilities of current carriers in corresponding directions was made a skeleton of the molecule consisting of carbon atoms only was considered without taking into account the existence of hydrogen atoms. The present results indicate that neglecting the effect of hydrogen atoms may at least in some cases, be an approximation too rough for the theory of organic semiconductors. The author thanks Dr. K. Pigon for his valuable discussion and help in the course of this work. Orig. art. has: 3 figures. [Based on author's abstract]
